

Cloud and Web Development

Frontend

Modern frontend development uses HTML, CSS, JavaScript, React, TypeScript, and frameworks such as Next.js. State management can be handled using Context API, Redux, or Zustand.

Backend

REST APIs are commonly built with FastAPI, Express.js, Django, or Spring Boot. Authentication often uses JWT and OAuth.

Databases

Relational databases include MySQL and PostgreSQL. NoSQL databases include MongoDB and Redis. Indexing improves query performance.

Cloud

Cloud providers such as AWS, Azure, and Google Cloud offer virtual machines, object storage, managed databases, serverless computing, and monitoring services.

DevOps

CI/CD pipelines automate testing and deployment. Docker packages applications into containers, while Kubernetes orchestrates containerized workloads.
